## Jan. 13 — Overview and Review

### 1.1 Course Overview

**Remark.** This course will cover the following topics:

- (i) vector bundles and line bundles in algebraic geometry;
- (ii) coherent sheaves;
- (iii) differentials;
- (iv) sheaf cohomology: in particular, we will see that  $H_{\text{dR}}^k(X^{\text{an}}, \mathbb{C}) = \bigoplus_{i+j=k} H^i(X, \wedge^j T_X^*)$ ;
- (v) the Riemann-Roch theorem: if  $\omega = f dz$  is a rational 1-form on a smooth projective curve  $C$ , then

$$(\# \text{ zeroes of } \omega) - (\# \text{ poles of } \omega) = 2 \text{ genus}(C) - 2;$$

- (vi) surfaces and toric varieties;
- (vii) schemes: for example,  $\text{Spec } \mathbb{Z}$  has points corresponding to the primes  $p$  and 0.

### 1.2 Review of Algebraic Geometry I

**Remark.** Let  $k = \bar{k}$  be an algebraically closed field.

**Remark** (Hilbert's Nullstellensatz). There is a correspondence

$$\begin{aligned} \text{closed subvarieties of } \mathbb{A}^n &\longleftrightarrow \text{radical ideals in } k[x_1, \dots, x_n] \\ Z &\longmapsto I(Z) \\ V(J) &\longleftarrow J. \end{aligned}$$

Under this correspondence,  $Z$  being irreducible (resp. a point) corresponds to  $I(Z)$  being prime (resp. maximal).

**Remark** (Zariski topology on  $\mathbb{A}^n$ ). The closed sets in  $\mathbb{A}^n$  are of the form  $V(J)$ , and this induces a Zariski topology on any subset of  $\mathbb{A}^n$ .

**Remark** (Embedded affine varieties). Let  $J \subseteq k[x_1, \dots, x_n]$ . Then we can associate to  $J$  a ringed space  $(X, \mathcal{O}_X)$  by setting  $X := V(J) \subseteq \mathbb{A}^n$  with the Zariski topology, and  $\mathcal{O}_X$  to be the sheaf of regular functions on  $X$ , i.e. for  $U \subseteq X$  open, we have

$$\mathcal{O}_X(U) := \{\varphi : U \rightarrow k \mid \varphi \text{ is regular}\}.$$

Here,  $\varphi : U \rightarrow k$  is *regular* if for each  $p \in U$ , there exists an open set  $p \in U_p \subseteq U$  and  $f, g \in k[x_1, \dots, x_n]$  such that  $\varphi(x) = f(x)/g(x)$  for all  $x \in U_p$ .

**Remark** (Coordinate ring). The *coordinate ring* of  $X$  is

$$A(X) := \mathcal{O}_X(X) \cong k[x_1, \dots, x_n]/I(X).$$

We also get a version of Hilbert's Nullstellensatz for  $A(X)$ :

$$\text{closed subsets of } X \longleftrightarrow \text{radical ideals of } A(X).$$

**Remark** (Distinguished open sets). The *distinguished open sets* of  $X$  are

$$D(f) := \{x \in X : f(x) \neq 0\} = X \setminus V(f).$$

These form a basis for  $X$  as we vary  $f \in A(X)$ .

**Definition 1.1.** An *affine variety* is a ringed space  $(X, \mathcal{O}_X)$  (here  $\mathcal{O}_X$  is a sheaf of  $k$ -valued functions) which is isomorphic to an embedded affine variety.

**Example 1.1.1.** If  $(X, \mathcal{O}_X)$  is an affine variety and  $f \in \mathcal{O}_X(X)$ , then

$$(D(f), \mathcal{O}_X|_{D(f)})$$

is again an affine variety. To see this, we may assume that  $X = V(J) \subseteq \mathbb{A}^n$  with  $J \leq k[x_1, \dots, x_n]$  a radical ideal. Now we can define a map

$$\begin{aligned} D(f) &\longrightarrow V(J, fy - 1) \subseteq \mathbb{A}_{x_i}^n \times \mathbb{A}_y^1 \\ x &\longmapsto (x, 1/f(x)), \end{aligned}$$

which one can check is an isomorphism. Now that this also shows

$$\mathcal{O}_X(D(f)) = A(D(f)) \cong \frac{k[x_1, \dots, x_n, y]}{(J, fy - 1)} \cong \frac{(k[x_1, \dots, x_n]/J)[y]}{(\bar{f}y - 1)} \cong A(X)_f.$$

**Theorem 1.1.** *There is an equivalence of categories*

$$\begin{aligned} \Phi : \text{Aff-var} &\longrightarrow \text{Red-f.g.-}k\text{-alg}^{\text{op}} \\ (X, \mathcal{O}_X) &\longmapsto A(X). \end{aligned}$$

This implies the following:

1. There is a bijection

$$\begin{aligned} \text{Hom}_{\text{aff-var}}(X, Y) &\longrightarrow \text{Hom}_{k\text{-alg}}(A(Y), A(X)) \\ f &\longmapsto f^*. \end{aligned}$$

2. For any reduced finitely generated  $k$ -algebra  $A$ , there exists an affine variety with  $A \cong A(X)$ .

**Remark.** How can we explicitly define the inverse functor  $\text{Red-f.g.-}k\text{-alg}^{\text{op}} \rightarrow \text{Aff-var}$ ? We can define this as  $A \mapsto (X, \mathcal{O}_X)$ , where  $X$  is the set of maximal ideals of  $A$ . Think about what  $\mathcal{O}_X$  should be.

**Remark** (Varieties). A *variety*  $(X, \mathcal{O}_X)$  is a ringed space such that

- there exists a finite open cover of  $X$  by affine varieties,
- the diagonal  $\Delta_X$  is closed in  $X \times X$ .

**Example 1.1.2.** The following are examples of varieties:

- affine varieties,
- open or closed subsets of varieties,
- $\mathbb{P}^n = (\mathbb{A}^{n+1} \setminus \{0\})/k^\times$ .

**Remark** (Projective spaces). Recall that  $\mathbb{P}^n$  has an open cover by

$$U_i = \{[x] \in \mathbb{P}^n : x_i \neq 0\} \cong \mathbb{A}^n.$$

A basis for  $\mathbb{P}^n$  by distinguished open sets is given by

$$D(f) = \{[x] \in \mathbb{P}^n : f(x) \neq 0\}$$

with  $f \in k[x_0, \dots, x_n]$  homogeneous.

### 1.3 Vector and Line Bundles

**Definition 1.2.** Let  $X$  be a variety. A *vector bundle (of rank  $m$ )* on  $X$  is a variety  $\mathbb{E}$  with a morphism  $p : \mathbb{E} \rightarrow X$  such that

1.  $\mathbb{E}_x = p^{-1}(X)$  has the structure of a rank  $m$  vector space for every  $x \in X$  (i.e.  $k^m$ ),
2. for every  $x \in X$ , there exists an open neighborhood  $x \in U \subseteq X$  and an isomorphism  $p^{-1}(U) \rightarrow U \times \mathbb{A}^m$  such that for any  $y \in U$ , the map  $\mathbb{E}_y \rightarrow \{y\} \times \mathbb{A}^m$  is an isomorphism of vector spaces, i.e.

$$\begin{array}{ccc} p^{-1}(U) & \xrightarrow{\phi_U} & U \times \mathbb{A}^m \\ & \searrow p \quad \swarrow \text{proj} & \\ & U & \end{array}$$

commutes. We will call the map  $\phi_U$  a *trivialization*.

**Definition 1.3.** A *line bundle* on  $X$  is a rank 1 vector bundle.

**Remark.** A different way to think about this is the following:

1. Given two trivializations  $\phi_U : p^{-1}(U) \rightarrow U \times \mathbb{A}^m$  and  $\phi_V : p^{-1}(V) \rightarrow V \times \mathbb{A}^m$ , we get a morphism

$$\begin{array}{ccc} (U \cap V) \times \mathbb{A}^m & \xrightarrow{\phi_{U,V}} & (U \cap V) \times \mathbb{A}^m \\ & \searrow \phi_V^{-1} \quad \swarrow \phi_U & \\ & p^{-1}(U \cap V) & \end{array}$$

with  $\phi_{U,V} = \phi_U \circ \phi_V^{-1}$ . Observe  $\phi_{U,V}(x, v) = (x, g_{U,V}(x)v)$  for some  $g_{U,V}(x) \in \mathrm{GL}(m, k)$ . Furthermore,  $g_{U,V} : U \cap V \rightarrow \mathrm{GL}(m, k)$  is a morphism. We will call the  $g_{U,V}$  *transition functions*.

In the special case where  $m = 1$  (so  $\mathbb{E}$  is a line bundle and  $\mathrm{GL}(1, k) = k^\times$ ), the map  $g_{U,V} : U \cap V \rightarrow \mathrm{GL}(m, k)$  is equivalent to the data of a non-vanishing regular function  $g_{U,V} : U \cap V \rightarrow k$ .

2. The data of a vector bundle of rank  $m$  is equivalent to the data of

- an open cover  $X = \bigcup_{i \in I} U_i$ ,
- and morphisms  $g_{i,j} : U_i \cap U_j \rightarrow \mathrm{GL}(m, k)$

such that  $g_{i,k} = g_{i,j}g_{j,k}$ ,  $g_{i,j} = g_{j,i}^{-1}$ , and  $g_{i,i} = \mathrm{id}$ .

To recover the vector bundle, we can glue  $\mathbb{E}_i = U_i \times \mathbb{A}^m$  for  $i \in I$  via

$$\begin{aligned}\mathbb{E}_{i,j} &= (U_i \cap U_j) \times \mathbb{A}^m \longrightarrow \mathbb{E}_{j,i} = (U_j \cap U_i) \times \mathbb{A}^m \\ (x, v) &\longmapsto (x, g_{i,j}(x)v).\end{aligned}$$

One can check that this defines a vector bundle  $\mathbb{E}$  on  $X$ .

**Example 1.3.1** (Trivial vector bundle). Define the vector bundle  $\mathbb{E} : X \times \mathbb{A}^m \rightarrow X$  by  $(x, v) \rightarrow x$ . Given a cover  $X = \bigcup_{i \in I} U_i$ , we get  $g_{i,j} : U_i \cap U_j \rightarrow \mathrm{GL}(m, k)$  as  $x \mapsto I_m$ .

**Example 1.3.2** (Trivial line bundle). We will denote the trivial line bundle by  $\mathbb{1}_X : X \times \mathbb{A}^1 \rightarrow X$ .

# Lecture 2

## Jan. 15 — Vector and Line Bundles

### 2.1 Vector and Line Bundles, Continued

**Example 2.0.1** (Tautological bundle). Let  $X = \mathbb{P}^n$  and  $\mathbb{L} = \{(\ell, x) \in \mathbb{P}^n \times \mathbb{A}^{n+1} : x \in \ell\}$ . Consider

$$\begin{array}{ccc} & \mathbb{L} & \\ p \swarrow & & \searrow q \\ \mathbb{P}^n & & \mathbb{A}^{n+1} \end{array}$$

The map  $q : \mathbb{L} \rightarrow \mathbb{A}^{n+1}$  is the blowup. We claim that  $p : \mathbb{L} \rightarrow \mathbb{P}^n$  is a line bundle. We have:

- $p^{-1}([x]) = \{([x], cx) : c \in k\} \cong kx$ , a 1-dimensional vector space;
- let  $U_i = \{[x] \in \mathbb{P}^n : x_i \neq 0\}$ , then we can define

$$\begin{aligned} p^{-1}(U_i) &\longrightarrow U_i \times \mathbb{A}^1 \\ ([x], y) &\longmapsto ([x], y_i), \end{aligned}$$

which we claim is a trivialization. To see this, observe that for fixed  $[x] \in \mathbb{P}^n$ , we have

$$\begin{aligned} \mathbb{L}_{[x]} &= \{([x], cx) : c \in k\} \longrightarrow \{[x]\} \times \mathbb{A}^1 \\ ([x], cx) &\longmapsto ([x], cx_i), \end{aligned}$$

which is a vector space isomorphism.

We can also compute the transition functions. Let  $U_{i,j} = U_i \cap U_j$ . We have

$$\begin{array}{ccccc} U_{i,j} \times \mathbb{A}^1 & \xrightarrow{\phi_j^{-1}} & p^{-1}(U_{i,j}) & \xrightarrow{\phi_i} & U_{i,j} \times \mathbb{A}^1 \\ & \nearrow \phi_{i,j} & & & \\ & & & & \\ ([x], t) & \longmapsto & ([x], (tx_0/x_j, \dots, tx_n/x_j)) & \longmapsto & ([x], tx_i/x_j). \end{array}$$

Thus we see that  $g_{i,j} = x_i/x_j$ . This is called the *tautological bundle*, or  $\mathcal{O}_{\mathbb{P}^n}(-1)$ .

**Example 2.0.2** (Hyperplane bundle, or  $\mathcal{O}_{\mathbb{P}^n}(1)$ ). Consider

$$\begin{aligned} \mathbb{L} &:= \mathbb{P}^{n+1} \setminus \{[0 : \dots : 0 : 1]\} \longrightarrow \mathbb{P}^n \\ [x_0 : \dots : x_n : x_{n+1}] &\longmapsto [x_0 : \dots : x_n]. \end{aligned}$$

Then  $\mathbb{L}$  is a line bundle with transition functions with respect to  $\{U_i\}$  given by  $g_{i,j} = x_j/x_i$  (HW).

## 2.2 Operations on Vector Bundles

**Remark.** The philosophy is: Every natural operation of vector spaces gives one for vector bundles.

**Example 2.0.3** (Direct sum). Let  $p : \mathbb{E} \rightarrow X$  and  $q : \mathbb{F} \rightarrow X$  be vector bundles of rank  $e$  and  $f$  on  $X$ , respectively. There exists trivializations with respect to a common open cover  $\{U_i\}$  (just take intersections) with transition functions  $g_{i,j}$  and  $h_{i,j}$  for  $\mathbb{E}$  and  $\mathbb{F}$ , respectively.

Then we define the vector bundle  $\mathbb{E} \oplus \mathbb{F} \rightarrow X$  as follows:

- As a set, it is  $r : \mathbb{E} \oplus \mathbb{F} = \{(x, u, v) : (x, u) \in \mathbb{E}, (x, v) \in \mathbb{F}\} \rightarrow X$ .
- We give  $\mathbb{E} \oplus \mathbb{F}$  the structure of a variety by requiring that

$$\begin{aligned} r^{-1}(U_i) &\longrightarrow U_i \times \mathbb{A}^{e+f} \\ (x, u, v) &\longmapsto (x, \text{pr}_2(\phi_i^E(x, u)), \text{pr}_2(\phi_i^F(x, v))) \end{aligned}$$

be an isomorphism, where  $\phi_i^E$  and  $\phi_i^F$  are the trivializations of  $\mathbb{E}$  and  $\mathbb{F}$ , and  $\text{pr}_2$  is the second projection. This gives a variety structure on  $r^{-1}(U_i)$ , and one can show that these are consistent on  $U_{i,j}$ , so that this gives a variety structure on all of  $\mathbb{E} \oplus \mathbb{F}$ .

Note that the transition functions for  $\mathbb{E} \oplus \mathbb{F}$  with respect to  $\{U_i\}$  are given by the block matrix

$$\begin{bmatrix} g_{i,j} & 0 \\ 0 & h_{i,j} \end{bmatrix} : U_{i,j} \longrightarrow \text{GL}(e+f, k).$$

**Example 2.0.4.** Let  $\mathbb{E}$  and  $\mathbb{F}$  be vector bundles on  $X$  of ranks  $e$  and  $f$ , respectively. Then the following are also vector bundles on  $X$ :

1.  $\text{Hom}(\mathbb{E}, \mathbb{F})$ , of rank  $ef$ ;
2.  $\mathbb{E}^\vee = \text{Hom}(\mathbb{E}, \mathbb{1}_X)$ , of rank  $e$ ;
3.  $\mathbb{E} \otimes \mathbb{F}$ , of rank  $ef$ ;
4.  $\wedge^k \mathbb{E}$  and  $\text{Sym}^d \mathbb{E}$ .

**Remark.** Let  $\mathbb{L}, \mathbb{M}$  be line bundles on  $X$  with trivializations on  $\{U_i\}$  and transition functions  $g_{i,j}, h_{i,j} \in \mathcal{O}_X(U_{i,j})^\times$ . In this case, we can describe operations on  $\mathbb{L}, \mathbb{M}$  more explicitly:

1.  $\mathbb{L} \otimes \mathbb{M}$  has transition functions  $g_{i,j}h_{i,j}$ ;
2.  $\text{Hom}(\mathbb{L}, \mathbb{M})$  has transition functions  $h_{i,j}/g_{i,j}$ ;
3.  $\mathbb{L}^\vee = \text{Hom}(\mathbb{L}, \mathbb{1}_X)$  has transition functions  $1/g_{i,j}$ ;
4.  $\mathbb{L}^{\otimes m} = \begin{cases} \mathbb{L}^{\otimes m}, & \text{if } m > 0, \\ \mathbb{1}_X, & \text{if } m = 0, \text{ has transition functions } g_{i,j}^m. \\ (\mathbb{L}^\vee)^{\otimes -m}, & \text{if } m < 0 \end{cases}$

**Example 2.0.5.** Define  $\mathcal{O}_{\mathbb{P}^n}(m) := \mathcal{O}_{\mathbb{P}^n}(1)^{\otimes m}$  with transition functions  $(x_j/x_i)^m$  with respect to the standard open cover for  $\mathbb{P}^n$ .

## 2.3 Morphisms of Vector Bundles

**Remark.** Let  $p : \mathbb{E} \rightarrow X$  and  $q : \mathbb{F} \rightarrow X$  be vector bundles on  $X$ , as before.

**Definition 2.1.** A *morphism of vector bundles*  $\mathbb{E} \rightarrow \mathbb{F}$  is a morphism of varieties

$$\begin{array}{ccc} \mathbb{E} & \xrightarrow{a} & \mathbb{F} \\ & \searrow p \quad \swarrow q & \\ & X & \end{array}$$

such that the diagram commutes and  $a$  is linear on each fiber.

**Remark.** More concretely, given an open cover  $\{U_i\}$  which trivializes both vector bundles, we have

$$\begin{array}{ccc} p^{-1}(U_i) & \xrightarrow{a} & q^{-1}(U_i) \\ \phi_i \downarrow \cong & & \cong \downarrow \psi_j \\ U_i \times \mathbb{A}^e & \longrightarrow & U_i \times \mathbb{A}^f \\ (x, v) & \longmapsto & (x, a_i(x)v) \end{array}$$

such that  $a_i : U_i \rightarrow \text{Hom}(k^e, k^f)$  is regular. On  $U_{i,j}$ , we have

$$\begin{array}{ccc} U_{i,j} \times \mathbb{A}^e & \xrightarrow{a_j} & U_{i,j} \times \mathbb{A}^f \\ g_{i,j} \downarrow & & \downarrow h_{i,j} \\ U_{i,j} \times \mathbb{A}^e & \xrightarrow{-a_i} & U_{i,j} \times \mathbb{A}^f \end{array}$$

So  $h_{i,j}a_j = a_ig_{i,j}$ , or equivalently,  $a_i = h_{i,j}a_jg_{i,j}^{-1}$ .

As a special case when  $e = f$ ,  $a : \mathbb{E} \rightarrow \mathbb{F}$  is an isomorphism if and only if the  $a_i$  are isomorphisms.

**Remark.** When is a line bundle  $\mathbb{L}$  given by the trivialization data  $\{U_i, g_{i,j}\}$  isomorphic to  $\mathbb{1}_X$ ? We have

$$\begin{aligned} \mathbb{L} \cong \mathbb{1}_X &\iff \text{if and only if there exists an isomorphism } a : \mathbb{1}_X \rightarrow \mathbb{L} \\ &\iff \text{there exist } a_i \in \mathcal{O}_X(U_i)^\times \text{ such that } (a_j/a_i)|_{U_{i,j}} = g_{i,j}. \end{aligned}$$

**Definition 2.2.** Define the *Picard group* of  $X$  to be

$$\text{Pic } X := \{\text{line bundles on } X\}/\cong.$$

This is a group with respect to  $\otimes$  with  $\mathbb{1}_X$  as the identity and  $\mathbb{L}^\vee \otimes \mathbb{L} \cong \mathbb{1}_X$ .

## 2.4 Global Sections

**Definition 2.3.** A *(global) section* of a vector bundle  $p : \mathbb{E} \rightarrow X$  is a morphism  $s : X \rightarrow \mathbb{E}$  such that  $p \circ s = \text{id}_X$ . Note that for  $x \in X$ , we have  $s(x) \in \mathbb{E}_x$ .

**Example 2.3.1** (Zero section). Let  $s : X \rightarrow \mathbb{E}$  where  $s(x)$  is the zero element in  $\mathbb{E}_x$ .

**Example 2.3.2.** Let  $\mathbb{E} = \mathbb{1}_X$ . Then sections  $s : X \rightarrow X \times \mathbb{A}^1$  of  $\mathbb{E}$  correspond to morphisms  $X \rightarrow \mathbb{A}^1$ , which correspond to regular functions  $X \rightarrow k$ .

**Remark** (Local description of sections). Let  $\{U_i, g_{i,j}\}$  be the trivialization data for  $\mathbb{E} \rightarrow X$ , and let  $s : X \rightarrow \mathbb{E}$  be a section. On  $U_i$ , we have:

$$\begin{array}{ccc} & U_i \times \mathbb{A}^e & \\ x \mapsto (x, s_i(x)) & \nearrow & \cong \uparrow \phi_i \\ U_i & \xrightarrow{s|_{U_i}} & p^{-1}(U_i) \end{array}$$

Note that  $s_i : U_i \rightarrow k^e$  is a regular function (i.e. regular on each coordinate). These maps must satisfy the compatibility condition  $s_i = g_{i,j} s_j$ .

**Example 2.3.3.** We can use the above compatibility condition to compute the global sections of  $\mathcal{O}_{\mathbb{P}^1}(1)$ . Write  $\mathbb{P}_{x_0:x_1}^1 = U_0 \cup U_1$ . Given a section  $s : \mathbb{P}^1 \rightarrow \mathcal{O}(1)$ , we get regular functions

$$\begin{aligned} s_0 : U_0 &\longrightarrow k \\ s_1 : U_1 &\longrightarrow k \end{aligned}$$

satisfying  $(x_1/x_0)s_1 = s_0$  (\*). We can write

$$s_0 = \sum_{m \geq 0} a_m (x_1/x_0)^m \quad \text{and} \quad s_1 = \sum_{m \geq 0} b_m (x_0/x_1)^m$$

with  $a_m, b_m \in k$  (finitely many nonzero). Then (\*) implies that

$$a_0 + a_1(x_1/x_0) + \cdots = (x_1/x_0)(b_0 + b_1(x_0/x_1) + \cdots),$$

so  $a_0 = b_1$ ,  $a_1 = b_0$ , and all other terms are 0. So we can relate  $s$  to a linear form

$$f = c_0 x_0 + c_1 x_1,$$

where  $s_0 = (x_1/x_0)f$  and  $s_1 = (x_0/x_1)f$ .
